LAYER9I, INC. · INVESTOR OVERVIEW · OCTOBER 2026

ATLAS identity

Your presence. **Your control.**

The internet should recognise you, not follow you.

THE PROBLEM

Today you have to choose between being private and being trusted. **With Atlas you don't.**

Trust breaks when you move

Change Wi-Fi, travel, or switch carriers, and banks and services treat you like a stranger: extra checks, blocked logins, locked accounts.

Privacy gets you blocked

The tools people use to stay private send them out through shared, rented addresses. Sites can't tell who is behind them, so they refuse them.

Your activity is someone's product

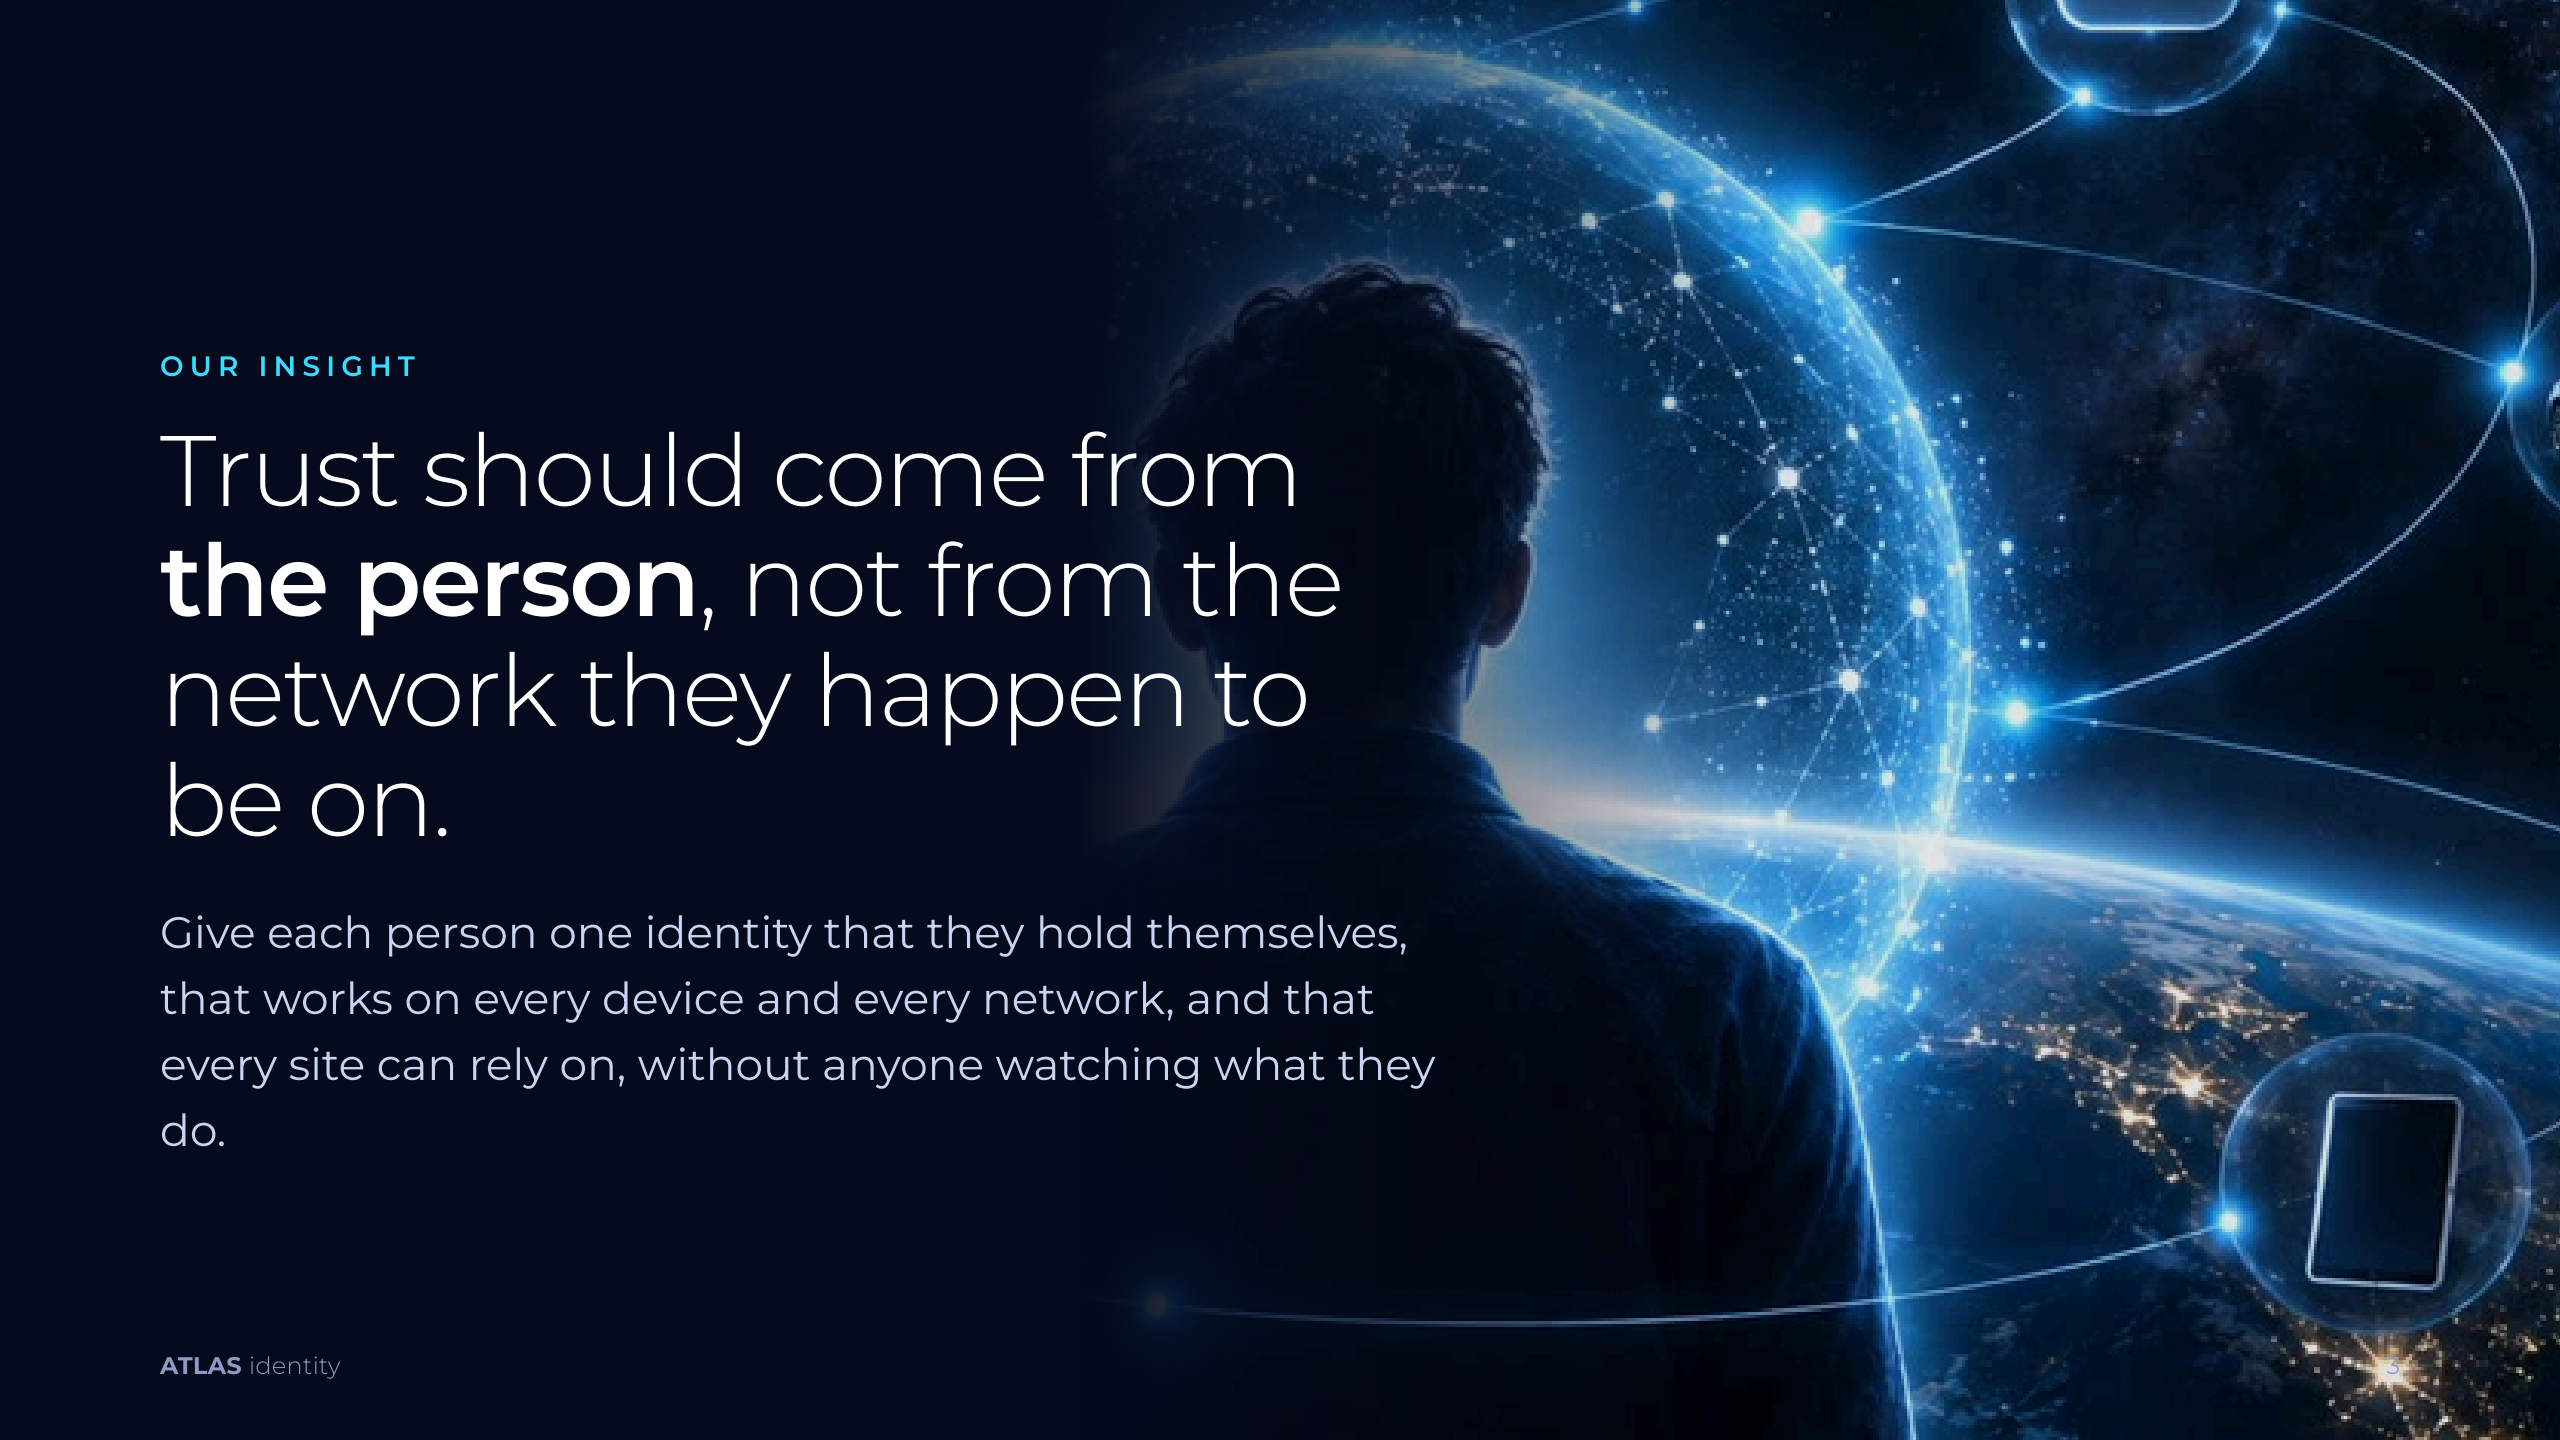

The companies that carry your traffic can see where you go, when and how often, and much of that is collected, packaged and sold.

People are forced to choose between being **private** and being **trusted**. They shouldn't have to.

OUR INSIGHT

Trust should come from **the person**, not from the network they happen to be on.

Give each person one identity that they hold themselves, that works on every device and every network, and that every site can rely on, without anyone watching what they do.

THE PRODUCT

One app. **Three promises**, every time you connect.

Trusted

Sites see the same you

Your bank, your work and your accounts see one consistent you, from a network Layer9i owns and answers for, wherever you really are.

Private

Nothing to track or sell

No record of the sites you visit. Your key and your rules are locked on your own devices. Each site gets its own separate ID, so they can't compare notes.

In control

You decide how you appear

Choose the city each part of your life appears from. See exactly what a site can tell about you, and get warned when an app checks in somewhere unknown.

One plan covers every device a person owns: **$7.99 a month** or **$69.99 a year**.

HOW IT WORKS, IN PLAIN WORDS

You hold the key. **Atlas carries you.** Sites see only what you allow.

1

Your key

Created on your phone from a recovery phrase only you have. Layer9i never sees or keeps it.

2

Your devices

Your key approves each phone, tablet and computer. Lose one, remove it, and nothing else changes.

3

Our network

Your connection is sealed and carried through the city you choose, on Layer9i's own registered network.

4

Each site

Sees a trusted, consistent you, with its own separate ID, and never your real location or your other accounts.

PRIVACY BY DESIGN

Built so that we **can't** misuse your data, not just so that we promise not to.

WHAT LAYER9I COULD SEE	HOW ATLAS IS BUILT INSTEAD
The sites you visit	No record is kept of the sites you visit or the apps you use.
Your settings and rules	Sealed on your own devices. The server holds only a locked copy it cannot open.
Your account key	Never leaves you. Recovery comes from your own phrase, not from us.
Who you are at each site	A different ID for every site, so no two sites can link you.
When you paid	Subscriptions start at fixed times each day, the same for everyone, so a payment can't be matched to activity.

NOT A PLAN. ALREADY RUNNING.

Built, live, and **checked in public.**

4
platforms

iPhone and iPad, Mac, Android and Windows, on one identity.

5
cities live

Toronto, Montreal, New York, London and Amsterdam.

Live
subscriptions

Paid sign-up, renewals and cancellations run end to end. Free while invite-only.

7 / 7
security issues fixed

Every server tested, account isolation proven live, review published.

Own
internet network

Registered network number and address blocks, secured and live.

1 key
per person

Identity held by the person, issuing every device, recoverable only by them.

Sign-in
with Atlas

A demonstration bank already accepts Atlas identity, with a separate ID per site.

< 3
months to build

From first line to all of the above, by a founder with a network-engineering background.

OUR OWN NETWORK

Sites trust a network that **answers for itself.**

Most privacy tools borrow cloud addresses that sites already distrust. Layer9i is a registered network operator with its own addresses, so the people behind them are not lumped in with strangers.

Registered and secured

Our own network number and address blocks, issued by the North American registry, with cryptographically signed routes.

Every city mapped

Each city has its own reserved block and is published to location services, so sites place people correctly.

Room to grow

Planned next: Vancouver, Chicago, Los Angeles and Frankfurt, already reserved in our address plan.

Live: Toronto · Montreal · New York · London · Amsterdam

Reserved: Vancouver · Chicago · Los Angeles · Frankfurt

TRUST, EARNED IN THE OPEN

We tested ourselves, fixed everything, and **published the results.**

6

servers checked on every port

From the internet, each answers only on secure web. Administrator access is off the public internet entirely.

0

paths between accounts

Two test accounts on the live network could not reach each other, our servers, or a real customer's device.

7 / 7

issues fixed the same day

One high, three medium, three low. Each fixed, tested and checked on the live system.

Next: an independent penetration test before public launch.

BUSINESS MODEL

A simple subscription, **then the services that rely on it.**

Now

People

$7.99 a month or $69.99 a year, every device included. No ads, no data sales, ever. The subscription is the whole business.

Next

Families and small teams

Shared plans, and the Atlas home unit that brings TVs and home devices under the same identity.

Later

Sites that sign people in with Atlas

Banks and services that accept Atlas identity get fewer fraud checks and lockouts. They pay for the trust.

WHO WE START WITH

People who already feel the problem **every week.**

People on the move

Travellers, remote workers and cross-border families locked out of their own accounts by where they connect from.

Privacy-minded people

Tired of choosing between being private and being able to use their bank, their streaming and their work.

Small teams

Who need trusted, predictable access from anywhere, without an enterprise IT department.

Invite-only today, to learn fast with real people, then open sign-up from layer9i.com.

ROADMAP

From working product **to public launch.**

WHEN	MILESTONE
Done	Apps on four platforms · five cities · own network and addresses · live subscriptions · public security review
Next	Every city on Layer9i's own addresses · ad and tracker blocking · independent security test · app store releases
Then	Public launch from layer9i.com · Atlas home unit · Vancouver, Chicago, Los Angeles, Frankfurt
Later	Layer9i-owned equipment in its own data centre space · services that sign people in with Atlas

TEAM

Built by someone who runs **networks for a living.**

The founder is a network and data-centre engineer who designed, built and operates every part of Atlas: the apps, the identity engine, the network and the cities. Layer9i, Inc. is a Delaware C-corporation with its own bank account, company mail, registered network and code under company ownership.

Next hires: product and design, then customer success at launch.

THE ASK

$400k to $750k **to take Atlas from invite-only to public launch.**

Post-money SAFE, $6M to $8M cap. Exact amount and cap are set before any signed note.

Launch

Independent security test and app store releases.

Network

Every city on Layer9i addresses, then four more cities.

Product

Ad and tracker blocking, family plans and the home unit.

Runway

Founder runway and first hires through launch.
